

The Labyrinth

A first-person low poly exploration and puzzle game set inside a mysterious garden labyrinth.

Overview

The Labyrinth is a single-player first-person exploration game developed with **Godot 4.x**.

The player explores a massive garden labyrinth composed of interconnected regions, solving environmental puzzles while navigating using only the environment itself.

There is no minimap.

Navigation relies entirely on observation, landmarks and spatial memory.

The game emphasizes:

- Exploration
 - Environmental storytelling
 - Spatial navigation
 - Atmospheric immersion
 - Environmental puzzles
 - Rare dynamic events
-

Project Status

Current phase:

Pre-production / Early Development

Documentation is being completed before gameplay implementation begins.

Engine

- Godot 4.x
-

```

GDD (Game Design Document)

Describes the game vision.

Contains:

- Core concept
- Gameplay loop
- Mechanics
- Art direction
- Audio direction
- Progression
- Design pillars

TDD (Technical Design Document)

Describes the technical architecture.

Contains:

- Project structure
- Systems architecture
- Save system
- Gameplay architecture

- Coding conventions
- Development roadmap

LDD (Level Design Document)

Describes the world.

Contains:

- Labyrinth structure
- Regions
- Landmarks
- Exploration flow
- Loops
- Puzzle placement
- Landscape rules

TASKS

Development backlog.

Tracks:

- Current tasks
- Priorities
- Milestones
- Progress

Development Philosophy

This project follows a few simple principles.

Build the smallest playable version first.

Every system should become playable before being expanded.

Prefer simple solutions.

Avoid unnecessary abstractions.

If two solutions solve the same problem, choose the simpler one.

Keep systems modular.

Each system should have a single responsibility.

Avoid premature optimization.

Optimize only after identifying real bottlenecks.

Documentation should reflect reality.

Whenever a major design or technical decision changes, update the corresponding documentation.

Development Workflow

The implementation generally follows this order:

1. Project setup
 2. Player controller
 3. Camera
 4. Interaction system
 5. Graybox labyrinth
 6. Save system
 7. Puzzle framework
 8. Rare events
 9. Environment art
 10. Polish
-

Coding Standards

General conventions:

- PascalCase for classes.
- camelCase for variables.
- UPPER_CASE for constants.
- One responsibility per script.
- Keep code readable.
- Prefer composition over unnecessary inheritance.

Complete conventions are documented in the TDD.

Assets

The project uses a **low poly** visual style.

Assets should follow:

- Clean silhouettes
 - Simple geometry
 - Consistent scale
 - Reusable modular pieces
-

Goal

The initial objective is to develop a complete, polished and self-contained game.

Additional features should only be added if they improve the core exploration experience.
